`jstat`: GC statistics over time

`jstat` samples the GC counters of a running JVM at an interval, without a dump.

```
jstat -gcutil <pid> 1s 5          # five samples, one per second

    E      O      M    YGC     YGCT    FGC    FGCT     GCT      (columns trimmed)
 0.00  26.38  97.46      0    0.000      2   0.045   0.045
```

- `E`, `O`, `M`: percent used of eden, old generation and metaspace.
- `YGC` and `FGC` count young and full GCs; `GCT` is the total GC time in seconds.

Choosing a `jstat` option

Option	Shows
`-gcutil`	Percent used per generation, GC counts and times
`-gc`	The same in KB: capacities and used sizes
`-gccapacity`	Minimum, maximum and current capacity per generation
`-gcnew`	Young generation: survivor spaces and tenuring
`-class`	Classes loaded and unloaded
